

ABSTRACT OF THE DISCLOSURE

Systems and methods for providing distributed notification of an emergency event are disclosed. A system according to the invention can include a remote device that is communicatively coupled to a base station. The remote device can include an activation
5 device, a GPS signal receiver, a remote device controller, and a location signal transmitter. The GPS signal receiver is adapted to receive global positioning signals from each of a plurality of global positioning satellites. The transmitter is adapted to transmit location signals to the base station. The base station can include a contact profile data store, a location
10 signal receiver, a base station controller, and a notification signal transmitter. The location signal receiver is adapted to receive location signals from the remote device. The notification signal transmitter is adapted to transmit notification signals to each of a plurality of contacts, which can include an emergency service.
